

# Wedges, oil, and vinegar

A new algorithm for UOV in characteristic 2

---

Lars Ran

May 6, Rump Session Eurocrypt 2025

A new wedge product-based algorithm

Leverages the fact that the polar forms of the UOV public key in characteristic 2 are alternating

## Why should you care?

| Scheme | $v$ | $o$ | $m$ | $q$   | $o'$ | Complexity | SL  |
|--------|-----|-----|-----|-------|------|------------|-----|
| UOV    | 68  | 44  | 44  | $2^8$ | 18   | 140        | I   |
|        | 96  | 64  | 64  | $2^4$ | 22   | 175        | I   |
|        | 112 | 72  | 72  | $2^8$ | 26   | 206        | III |
|        | 148 | 96  | 96  | $2^8$ | 32   | <b>257</b> | V   |
| MAYO   | 64  | 17  | 64  | $2^4$ | 13   | <b>112</b> | I   |
| SNOVA  | 74  | 34  | 68  | $2^4$ | 15   | <b>127</b> | I   |
|        | 75  | 24  | 72  | $2^4$ | 14   | <b>123</b> | I   |
|        | 96  | 20  | 80  | $2^4$ | 19   | 160        | I   |
|        | 112 | 50  | 100 | $2^4$ | 20   | <b>174</b> | III |
|        | 147 | 33  | 99  | $2^4$ | 31   | 249        | III |
|        | 148 | 32  | 128 | $2^4$ | 26   | 224        | III |
|        | 120 | 25  | 125 | $2^4$ | 19   | <b>172</b> | III |
|        | 150 | 66  | 132 | $2^4$ | 26   | <b>225</b> | V   |
|        | 198 | 45  | 135 | $2^4$ | 40   | 323        | V   |
|        | 145 | 30  | 150 | $2^4$ | 22   | <b>200</b> | V   |

Central map:

$$f_k(\mathbf{x}) = \sum_{\substack{i \leq n \\ j \leq v}} \alpha_{ij}^{(k)} x_i x_j = \mathbf{x}^\top \mathbf{F}_k \mathbf{x}$$

Polar form:

$$\mathbf{F}_k + \mathbf{F}_k^\top = \sum \alpha_{ij}^{(k)} \mathbf{e}_i \wedge \mathbf{e}_j$$

# The UOV public map

Central map:

$$f_k(\mathbf{x}) = \sum_{\substack{i \leq n \\ j \leq v}} \alpha_{ij}^{(k)} x_i x_j = \mathbf{x}^\top \mathbf{F}_k \mathbf{x}$$

Polar form:

$$\mathbf{F}_k + \mathbf{F}_k^\top = \sum \alpha_{ij}^{(k)} \mathbf{e}_i \wedge \mathbf{e}_j$$

Similarly, with  $\{\mathbf{v}_1, \dots, \mathbf{v}_v\}$  a basis for  $O^\perp$ , the polar form of the public map  $p_k(x)$  is

$$\mathbf{Q}_k = \mathbf{P}_k + \mathbf{P}_k^\top = \sum \beta_{ij}^{(k)} \mathbf{v}_i \wedge \mathbf{e}_j$$

## The equations

For  $\{\mathbf{v}_1, \dots, \mathbf{v}_v\}$  a basis for  $O^\perp$  we obtain the following equality

$$\mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{Q}_k = \sum \beta_{ij}^{(k)} \mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{v}_i \wedge \mathbf{e}_j = \mathbf{0}$$

## The equations

For  $\{\mathbf{v}_1, \dots, \mathbf{v}_v\}$  a basis for  $O^\perp$  we obtain the following equality

$$\mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{Q}_k = \sum \beta_{ij}^{(k)} \mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{v}_i \wedge \mathbf{e}_j = \mathbf{0}$$

And thus we construct a map with  $\mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v$  in the kernel

$$(-) \wedge \mathbf{Q} : \mathbb{F}_q^{\binom{n}{v}} \rightarrow \mathbb{F}_q^{m \binom{n}{v+2}}$$
$$\mathcal{V} \mapsto (\mathcal{V} \wedge \mathbf{Q}_1, \dots, \mathcal{V} \wedge \mathbf{Q}_m)$$

## The equations

For  $\{\mathbf{v}_1, \dots, \mathbf{v}_v\}$  a basis for  $O^\perp$  we obtain the following equality

$$\mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{Q}_k = \sum \beta_{ij}^{(k)} \mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v \wedge \mathbf{v}_i \wedge \mathbf{e}_j = \mathbf{0}$$

And thus we construct a map with  $\mathbf{v}_1 \wedge \dots \wedge \mathbf{v}_v$  in the kernel

$$(-) \wedge \mathbf{Q} : \mathbb{F}_q^{\binom{n}{v}} \rightarrow \mathbb{F}_q^{m \binom{n}{v+2}}$$
$$\mathcal{V} \mapsto (\mathcal{V} \wedge \mathbf{Q}_1, \dots, \mathcal{V} \wedge \mathbf{Q}_m)$$

If the kernel is of dimension 1, we can find it using sparse linear algebra, and hence retrieve the oil space!

## Experimental evidence

Tested the rank prediction for 3188 different (non-trivial) parameter sets  $(v, o, m)$

Only 7 notable exceptions corresponding to  $v \geq 2m$

After further analysis these can be accounted for with a single rule

Perfect prediction for all 3188 instances

# Thanks for listening!
